**Re: Blast Vibration Data Summary Report: College Hill 7.5 MG Storage Tanks – Demolition and Earthwork Project, Eugene, OR**

Dear Mr. Jeremiah

This transmittal summarizes the Blast vibration Monitoring program at the College Hill site in Eugene, OR where 30 separate controlled blasts were used to fracture rock that was subsequently excavated to expose the bedrock foundation for EWEB's new potable water storage tanks. This is an extremely important project that significantly advances EWEB's ability to serve the area with potable water.

## **Project Summary**

Drill and Blast excavation was selected over the use of impact hammers to reduce noise impacts to the surrounding community and allow the project to be completed in a reasonable schedule and at a reasonable cost. EWEB's Prime Contractor selected Aggregate Resource Industries, Inc as the Blasting Subcontractor and SubTerra, Inc. as the Blast Monitoring Consultant. Aggregate Resource Industries, Inc and SubTerra, Inc. had successfully completed a similar project in Eugene in 2021.

Aggregate Resource Industries, Inc completed a pre-blast survey of properties surrounding the project site and, along with EWEB personnel, met with the Owners to discuss the project, work required, methods that would be used and expected project outcomes. Dr. Chris Breeds of SubTerra, Inc visited the site on November 7<sup>th</sup>, 2024 and delivered an open air presentation on the planned controlled blasting program, and expected outcomes, to a cross section of interested neighbors. Input was also provided by Eric Jennings (ARI VP), Laura Farthing (EWEB PM) and senior members of EWEB.

EWEB provided the meeting participants with a recap of the presentation made by Dr. Breeds including "key take aways" from what was discussed and two publications:

- A Guide to the Differences Between Blasting and Earthquakes.
- A white paper on blast vibration criteria.

SubTerra, Inc. subsequently developed a Blast Vibration Monitoring Plan which discussed the regulatory basis for blast planning in Oregon including the Alternative Blasting Level Criteria

contained in NFPA-495 (2023) and estimated the magnitude of vibrations from the first blast that was designated as a “Test Blast”.

The first Test Blast was carried out with Jerry Wallace, ARI’s Blasting Consultant in attendance on November 19, 2024 followed by 29 additional blasts completed between November 20 and January 14, 2025 as shown in Table 1.

### **Planning the Blast Vibration Evaluation and Monitoring Program**

The planning process described above paralleled guidance for Construction Vibration Assessments provided in Section 12.2 of the Federal Transit Authority (FTA) Manual and guidance contained in a more detailed Manual<sup>1</sup>, published by the California Department of Transportation. This Guidance Manual contains an eight-step approach recommended to mitigate potential problems and public concerns over construction vibrations. These steps include:

1. Identify problem areas surrounding the Project Site
2. Determine conditions that exist before construction begins.
3. Inform the public about the project and potential vibration related consequences.
4. Schedule work to reduce adverse effects.
5. Design construction activities to reduce adverse effects.
6. Notify nearby residents and property owners that vibration-generating activity is imminent.
7. Monitor and record vibration from the activity.
8. Respond to and investigate complaints.

EWEB and their Contractors completed each step of this process.

### **Regulatory Basis for Blast Vibrations**

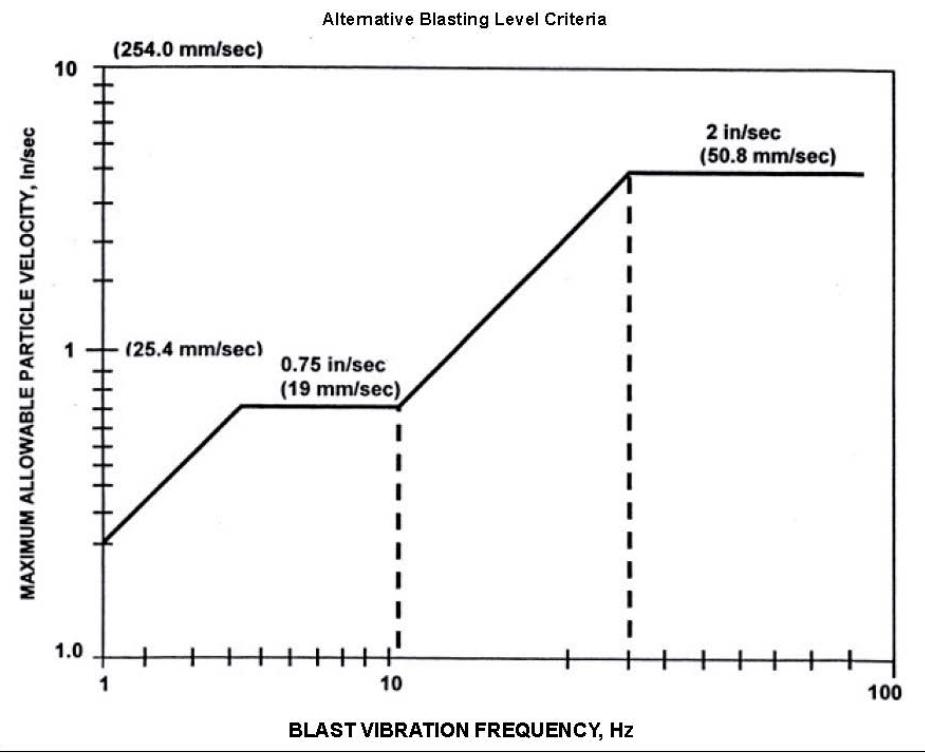

NFPA-495, updated in 2023, contains the “Alternative Blasting Level Criteria” adopted for use in the State of Oregon. These criteria take the form of a graph as shown on the following page.

The frequency based NFPA-495 criteria are based on a 1982 United States Bureau of Mines (USBM) report that evaluated damage to drywall materials from blasts where the USBM monitored vibration magnitude and the vibration frequency on the ground adjacent to structures as the blasting work moved closer to each structure. The thick black line on the individual residential property Peak Particle Velocity vs Frequency graphs therefore represents a limit where no damage to drywall was recorded for any data that plotted below the line, with a suitable safety factor.

Blast No 15	Monday, December 16, 2024	Blast No 30	Tuesday, January 14, 2025

Further comment on these frequency based criteria has been made by a nationally renowned Educator and Engineer, Dr. Charles Dowding in his 1985 text book , "Blast Vibration Monitoring and Control":

*"Regulations by their nature are conservative limits selected in a process that is not isolated from political concerns. The political concerns generally are focused on the determination of the socially acceptable probability of the occurrence of cracking. Recently, human annoyance has become an important issue in repeated blasting. Annoyance is distinct from cracking although it may affect the choice of regulatory limits."*

My own 35 plus years of experience mirrors Dr. Dowding's statement and the knowledge gained from hundreds of controlled blasts that the limits shown on the above graph are conservative with regard to residential structure damage.

### **Controlled Blast Monitoring Results**

We have included plots of Peak Particle Velocity (PPV) vs Frequency against the NFPA-495 Frequency Based Vibration Criteria for Blasting at each of the residences surrounding the College Hill site for which pre-blast condition surveys were performed. These data were developed from the Daily Blast Monitoring reports for five Blast Monitors that were installed around the project site using the following process:

1. A plot of PPV vs Distance was developed for each blast using the data from the five monitoring locations.

2. The PPV at each structure was then determined using the distance of each structure from each blast (see Table 2).
3. Figures 1 to 31 show the vibration levels for houses immediately adjacent to the site.
4. Figures 32 to 62 show the vibration levels for houses located beyond the houses that immediately surround the site where pre-blast condition surveys were also carried out.
5. Blast vibration levels at all houses behind houses immediately adjacent to the site will be lower than at the houses in front of them as vibration levels always decay with distance from each blast.

It is my opinion, based on more than 35-years of controlled blast design and blast monitoring experience, that Aggregate Resource Industries, Inc conducted their controlled blasting work in conformance with current NFPA-495 requirements and I would not expect any of the blasts to cause damage to the adjacent structures based on the vibration data recorded at the site.

All of SubTerra Inc's work involved in preparation of this deliverable was conducted in accordance with our Subcontract with Aggregate Resource Drilling, Inc. for this project.

Sincerely,

Chris D. Breeds, PE, PhD  
President, SubTerra, Inc.
